

MAS Mentor Platform — Plain-English Guide (for Sales & Non-Technical Teams)

What this is: A simple, jargon-free explanation of the **MAS mentor platform** — both the **student experience** (dashboard, roadmap, badges, progress) and the **admin panel** that powers it (courses, modules, batches, leads, Mr Test, Mr Learn, mapping). No technical knowledge needed.

Document version: 1.0 · Last updated: 2026-06-30 **Companion doc:**

The 30-Second Pitch

MAS (My Analytics School) is an end-to-end student success platform. It takes a person from being a *sales lead*, to an *enrolled student* in a *batch*, follows them through a structured *learning roadmap* (live classes, video courses, and tests), keeps them motivated with *XP, streaks, and badges*, connects them to *mentors*, and tracks them all the way to *placement*.

For the business, it's one system that runs the whole journey: **marketing & sales** → **enrollment** → **teaching** → **testing** → **mentoring** → **placement**.

The Big Picture — one student's journey

```
flowchart LR
    L[Lead\nsomeone interested] --> A[Application\nthey sign up & pay]
    A --> B[Batch\ntheir cohort]
    B --> R[Roadmap\ntheir learning plan]
    R --> C[Mr Learn courses\nvideo lessons]
    R --> T[Mr Test exams\nassessments]
    R --> M[Live classes & mentors]
    C --> P[Progress, XP, badges]
    T --> P
    M --> P
    P --> J[Placement / job applications]
```

Everything in the platform is built around this flow. The **admin panel** sets it up; the **student dashboard** is what the learner sees.

Part 1 — The Student Experience

What a student sees on their dashboard

When a student logs in, their personal dashboard shows:

- **Their roadmap** — a clear, ordered learning plan for their batch: what to study each week (video courses, tests, live classes, assignments, projects, milestones), with progress on each item.
- **Progress ribbon** — their **Level** (1 to 5), total **XP** (experience points), and their **streak** (how many days in a row they've shown up), with an "on fire today" indicator.
- **Badges** — achievement awards they've earned (and ones still locked, with how to unlock them).
- **Courses & classes** — the video courses and live sessions assigned to them.
- **Quizzes & AI classrooms** — practice and interactive AI-led lessons.
- **Mentor calls** — booking and joining 1-on-1 sessions with mentors.
- **Tokens** — their balance of credits used to book mentor sessions.
- **Application & placement status** — where they stand, including the "Pay After Placement" agreement if applicable.

The Roadmap (what the student follows)

The roadmap is the heart of the student experience — an **ordered list of learning steps** for their batch. Each step is one of:

Step type	What it is
 Module	A block of learning (often a video course)
 Test	An assessment / exam
 Assignment	Work to submit
 Live Class	A scheduled live session
 Webinar	A talk or special session
 Project	A hands-on project
 Milestone	A checkpoint or achievement marker

Steps are organized by **week** (or day/session/step, depending on the course). A student sees each step, what's inside it (the actual video course or exam), their progress, and any session notes the team added. Some tests are **locked until** the student finishes a required course first.

Important nuance: Two students in the *same batch* can follow *different courses/roadmaps* — the platform supports per-student plans.

Gamification — XP, Levels, Streaks, Badges (keeps students engaged)

This is a strong sales talking point: **students stay motivated because the platform rewards them.**

- **XP & Levels:** Students earn points for logging in, completing modules, taking tests, finishing mentor calls, etc. Points move them up through 5 levels.
- **Streaks:** Showing up daily builds a streak; hitting milestones (every 7 days) earns bonus rewards.
- **Badges (6 starter achievements):**

Badge	How a student earns it
Explorer	First login after onboarding
All Star	Completing their full profile
Momentum	A 7-day streak
Achiever	Passing their first test
Collaborator	Completing their first mentor call
Scholar	Finishing their first course module

When a student unlocks a badge, they get a celebration moment and bonus XP. This drives daily engagement and course completion.

Part 2 — The Admin Panel (how the team runs it)

The admin panel is where the team builds courses, creates batches, manages leads, and connects the testing and learning tools. Here's each major piece in plain English.

Leads & Sales CRM — turning interest into enrollment

A **lead** is a prospective student — someone who showed interest (via a form, a marketing campaign, a vendor list, or a CSV upload). The Sales CRM is where the team manages all of them.

How a lead becomes a student: 1. **Capture** — leads come in from the website, marketing campaigns, vendors, or uploads. 2. **Distribute** — leads are assigned to sales heads, then to

telecallers/counsellors. (Sales heads approve bulk assignments.) 3. **Qualify** — the team calls and follows up. Leads are marked **Hot / Warm / Cold**, with follow-up reminders (Overdue / Today / Upcoming). 4. **AI calling ("Aarya")** — an AI voice agent can call batches of leads automatically. Based on how long the lead stays on the call, the system shows an **AI-predicted interest** chip (Hot/Warm/Cold) to help the team prioritize. 5. **Automation workflows** — the team can build automated nurture sequences: AI call → if Hot, send WhatsApp/email → wait → follow up. 6. **Convert** — an interested lead becomes a paid **Application**, then gets assigned to a **Batch**. 7. **Pay After Placement (MAS101)** — for the flagship program, students go through a digital agreement/MOU signing flow after payment.

Sales talking points: every lead is tracked, never lost; AI calling scales outreach; predicted-interest helps reps focus on the hottest prospects; the whole funnel from first contact to enrollment is in one place.

Courses — the learning content

There are a few kinds of "course" in the system, each with a purpose:

- **Classic Course** — the real program with a **roadmap** and modules. This is what enrolled students follow.
- **New Courses (marketing catalog)** — the polished course cards shown on the public website (with pricing, highlights, badges-as-labels).
- **Course Plans** — AI-generated multi-lecture courses used to create **AI Classrooms** (50–200 AI lessons).

Modules — the building blocks of a course

A **module** is a teaching unit inside a course (it holds classes, quizzes, and assignments). Admins create modules, order them, and can assign specific modules to a specific batch. Think of a course as a book and modules as its chapters.

How a roadmap is created

The roadmap is built in the **course editor**: 1. Open the course and go to the Roadmap section. 2. **Add items** one by one — pick a type (Module, Test, Live Class, etc.), give it a title, set its week, add a description, thumbnail, links, and attachments. 3. **Drag to reorder** items; group them by week. 4. Admins can create **custom step types** (with their own emoji + color) beyond the seven built-ins. 5. Roadmaps can also be **imported from a file** (JSON) — one course at a time, or in bulk (up to 50 courses at once).

How to create a batch

A **batch** is a cohort of students going through a program together. To create one: 1. Click **Create** in the Batches section. 2. Fill in: **batch code** (e.g. "mas101"), name, the **course** it runs (optional — it can be independent), start/end dates, **max students**, **pricing** (offer price + original/MRP price), GST settings, required documents (Aadhaar, college ID, resume, etc.), a banner image, the batch lead, and WhatsApp group links. 3. Save. Students get added to the batch through their applications, and admins can even assign a **different course per student** within the same batch.

Admins also get **batch analytics** — number of students, mentor connects, tokens used, revenue generated, and per-student breakdowns with Excel export.

Mapping — how everything connects

"Mapping" is how the team wires the pieces together so a student gets the right content:

```
flowchart TD
    LEAD[Lead] --> APP[Application: student + batch + course + status]
    APP --> BATCH[Batch]
    BATCH --> COURSE[Course default - can be overridden per student]
    COURSE --> MOD[Modules: classes, quizzes, assignments]
    COURSE --> ROAD[Roadmap items by week]
    BATCH -. attach per roadmap item .-> MRL[Mr Learn courses]
    BATCH -. attach per roadmap item .-> MRT[Mr Test exams]
    BATCH -. session notes per item .-> NOTES[Roadmap notes]
```

In practice, in a screen called the **Course Builder**, the team takes each roadmap step and attaches the actual **Mr Learn video courses** and **Mr Test exams** the batch's students should get — and can require a course to be completed before a test unlocks.

Mr Test — the exams product

Mr Test is the testing/assessment side, powered by an external exam engine (EzExam). From the admin panel the team can: - Browse available exams and see results. - Push MAS students into the exam system as test-takers. - **Sync** exam results back into MAS so they show up on the student's roadmap and feed badges/progress. - Attach an exam to a batch's roadmap (optionally locked behind a required course).

In one line: Mr Test = the platform's exams and test-series, with results flowing back into each student's record.

Mr Learn — the video learning product

Mr Learn is the video-course / LMS side, powered by an external LMS (Graphy). From the admin panel the team can: - Browse video courses and manage learners. - Push MAS students into the LMS as learners. - **Sync** each student's course progress back into MAS. - Send **automatic WhatsApp reminders** to nudge students who are falling behind. - Attach courses to a batch's roadmap.

In one line: Mr Learn = the platform's video courses, with progress tracking and automatic reminders.

How Mr Test & Mr Learn differ: Mr Test = *exams*; Mr Learn = *video lessons*. Both pull their results/progress back into the student's MAS roadmap so everything lives in one place.

Why customers love the platform (talking points)

- **One platform, whole journey** — sales, enrollment, teaching, testing, mentoring, and placement in a single system.
- **Structured learning** — every student follows a clear weekly roadmap, not a pile of random content.
- **Engagement built-in** — XP, streaks, and badges keep students coming back and finishing courses.
- **Personalized** — students in the same batch can follow different plans.
- **Smart sales** — AI calling and predicted-interest help the team convert more leads with less effort.
- **Nothing falls through the cracks** — leads, progress, test results, and reminders are all tracked automatically.
- **Mentor + placement focus** — built around outcomes, including Pay-After-Placement programs.

Common questions

- *"Is Mr Test / Mr Learn built in-house?"* — They're admin consoles that connect to specialist external tools (an exam engine and an LMS) and pull all results back into MAS, so the team manages everything from one place.
 - *"Can two students in a batch learn different things?"* — Yes. Each student can be assigned their own course/roadmap.
 - *"How does the AI calling work?"* — An AI voice agent ("Aarya") calls leads, and the system predicts their interest level from the call so reps know who to prioritize.
 - *"What keeps students motivated?"* — A full gamification system: points, levels, daily streaks, and achievement badges.
